Abstract

The Aloe vera plant has been known and used for centuries for its health, beauty, medicinal and skin care properties. There are over 300 species of aloe, which grows mainly in the dry regions of Africa, Asia, Europe and America. The botanical name of Aloe vera is Aloe barbadensis miller. It belongs to Asphodelaceae (Liliaceae) family, and is a shrubby or arborescent, perennial, xerophytic, succulent, pea-green color plant. The plant has triangular, fleshy leaves with serrated edges, yellow tubular flowers and fruits that contain numerous seeds. Aloe vera contains 75 potentially active constituents: vitamins, enzymes, minerals, sugars, lignin, saponins, salicylic acids and amino acids. Several studies were done on aloe vera for evaluating different properties namely Antiulcer activity, Antidiabetic, Antihypercholestermic, Antioxidative Effect, Antibacterial activity, Antiviral activity, Antifungal activity, Antiacne, Cardiac stimulant, Nutraceutical, Moisturizer, Immunomodulator, Protection of skin from UV-A & UV-B rays and Wound healing property. Aloe vera could be used in various conditions like Mild to moderate burns, Erythema, Genital herpes, Seborrhic dermatitis, Psoriasis vulgaris, Skin moisturizer, Type 2 diabetes, Oral lichen planus infections, Angina pectoris, Ulcerative colitis, UV-induced erythema, Kidney stones and Alveolar osteitis. In general, topical application of aloe vera preparations has been regarded as safe as assessed by the Cosmetic Ingredient Review Expert Panel. However, several case reports of the development of hypersensitivity reactions and contact dermatitis in response to topically applied aloe gel preparations have been published.
REVIEW OF ALOE VERA

In recent times, focus on plant research has increased all over the world and a large body of evidence has collected to show immense potential of medicinal plants used in various traditional systems. In future more coordinated multidimensional research aimed at correlating botanical and phytochemical properties to specific pharmacological activities is expected.

The Aloe vera plant has been known and used for centuries for its health, beauty, medicinal and skin care properties. The name Aloe vera derives from the Arabic word "Alloeh" meaning "shining bitter substance," while "vera" in Latin means "true."

Aloe vera has been used for medicinal purposes in several cultures for millennia: Greece, Egypt, India, Mexico, Japan and China. Egyptian queens Nefertiti and Cleopatra used it as part of their regular beauty regimes. Alexander the Great, and Christopher Columbus used it to treat soldiers' wounds. The first reference to Aloe vera in English was a translation by John Goodyew in A.D. 1655 of Dioscorides' Medical treatise De Materia Medica. By the early 1800s, Aloe vera was in use as a laxative in the United States, but in the mid-1930s, a turning point occurred when it was successfully used to treat chronic and severe radiation dermatitis.

Medicinal species

There are over 300 species of aloe, most of which are native to South Africa, Madagascar and Arabia. The different species have somewhat different concentrations of active ingredients. Examples of different species are Aloe vera, A. vulgaris, A.arborescens, A.ferox (Cape aloe), A. perryi (Socotrine or Zanzibar aloe). The botanical name of Aloe vera is Aloe barbadensis miller. It belongs to Asphodelaceae (Liliaceae) family, and is a shrubby or arborescent, perennial, xerophytic, succulent, pea-green color plant.

Habitat

It grows mainly in the dry regions of Africa, Asia, Europe and America. In India, it is found in Rajasthan, Andhra Pradesh, Gujarat, Maharashtra and Tamil Nadu.

Plant description

The plant has triangular, fleshy leaves with serrated edges, yellow tubular flowers and fruits that contain numerous seeds. Each leaf is composed of three layers.

1) An inner clear gel that contains 99% water and rest is made of glucomannans, amino acids, lipids, sterols and vitamins.
2) The middle layer of latex which is the bitter yellow sap and contains anthraquinones and glycosides.
3) The outer thick layer of 15-20 cells called as rind which has protective function and synthesizes carbohydrates and proteins. Inside the rind are vascular bundles responsible for transportation of substances such as water (xylem) and starch (phloem).

Salicylic Acid
Arachidonic Acid
Structures of main anthraquinone compounds of aloe vera

![Structures of main anthraquinone compounds of aloe vera](image)

**Active components with its properties:**

Aloe vera contains 75 potentially active constituents: vitamins, enzymes, minerals, sugars, lignin, saponins, salicylic acids and amino acids.

- **Vitamins:** It contains vitamins A (beta-carotene), C and E, which are antioxidants. It also contains vitamin B12, folic acid, and choline. Antioxidant neutralizes free radicals.
- **Enzymes:** It contains 8 enzymes: aliase, alkaline phosphatase, amylase, bradykinase, carboxypeptidase, catalase, cellulase, lipase, and peroxidase. Bradykinase helps to reduce excessive inflammation when applied to the skin topically, while others help in the breakdown of sugars and fats.
- **Minerals:** It provides calcium, chromium, copper, selenium, magnesium, manganese, potassium, sodium and zinc. They are essential for the proper functioning of various enzyme systems in different metabolic pathways and few are antioxidants.
Sugars: It provides monosaccharides (glucose and fructose) and polysaccharides: (glucomannans/polymannose). These are derived from the mucilage layer of the plant and are known as mucopolysaccharides. The most prominent monosaccharide is mannose-6-phosphate, and the most common polysaccharides are called glucomannans [beta-(1,4)-acetylated mannan]. Recently, a glycoprotein with antiallergic properties, called alprogen and novel anti-inflammatory compound, C-glucosyl chromone, has been isolated from Aloe vera gel.

Anthraquinones: It provides 12 anthraquinones, which are phenolic compounds traditionally known as laxatives. Aloin and emodin act as analgesics, antibacterials and antivirals.

Fatty acids: It provides 4 plant steroids; cholesterol, campesterol, β-sisosterol and lupeol. All these have anti-inflammatory action and lupeol also possesses antiseptic and analgesic properties.

Hormones: Auxins and gibberellins that help in wound healing and have anti-inflammatory action.

Others: It provides 20 of the 22 human required amino acids and 7 of the 8 essential amino acids. It also contains salicylic acid that possesses anti-inflammatory and antibacterial properties. Lignin, an inert substance, when included in topical preparations, enhances penetrative effect of the other ingredients into the skin. Saponins that are the soapy substances form about 3% of the gel and have cleansing and antiseptic properties.

Studies on Aloe vera to evaluate different properties

1. Anti ulcer activity

A. vera extract inhibits acid secretion which may be due to the presence of lectins in the plant. It has been shown that lectins inhibit aminopyrine uptake by parietal cells, thus the ability of the extract to inhibit gastric acid output may be as a result of direct action on the acid producing cells.

2. Antidiabetic, Antihypercholestermic and Antioxidative Effect

The results of the study showed that the hypoglycemic effect of aloe vera gel extract might be due to the presence of hypoglycemic trace elements as Cr, Zn and Mn which potentiate insulin action. Also, the glucose lowering effect could be explained by the antioxidant activity of aloe vera gel extract because it attenuated oxidative damage in the serum of alloxan induced diabetic rats.

3. Antibacterial activity

A polyherbal formulation called BASANT had been constituted with curcumin, purified extracts of Emblica officinalis (Amla), purified saponins from Sapindus mukorossi, Aloe vera and rose water. It was shown to be effective in inhibiting Neisseria gonorrhoeae, Candida glabrata, Candida albicans and Candida tropicalis.

4. Antiviral activity

The study showed A.barbadensis extracts inhibited viral growth in human cell lines. The MS2 plaque reduction assay was used to detect antiviral activity.

5. Antifungal activity

The study showed antifungal property as they progressively inhibited the growth of M. furfur on Sabouraud's dextrose agar medium. Aloe vera was found more effective than other species tested.

6. Antiacne

It was concluded from the study that aqueous extract of Garcinia mangostana and Aloe vera can be formulated in an aqueous based gel system for topical therapy of mild acne vulgaris.

7. Cardiac stimulant

It was observed from the study that the active ingredient present in aloe vera may be acting either on the β-receptors or any other receptors that are blocked by propranolol, but was not able to identify the ingredients which is responsible for the positive inotropic and chronotropic effect on isolated heart.

8. In Polycystic ovarian syndrome

Data from an "in vitro" study indicated that AVG acts directly on key enzymes like 3β HSD, decreasing enzyme activity and modulating the flux toward estradiol formation. However, the specific phyto--component acting on the enzyme system needs to be identified. In conclusion, the present study indicated that AVG had potential efficacy in the prevention and maintenance of PCOS.

9. A Potent Nutraceutical

The Aloe vera gel showed a significant increase in body weight and hematological parameter, which confirmed its nutraceutical property. The investigation clearly indicated that Aloe vera gel has a powerful antioxidant activity against various oxidative systems and hematological activity. (It is also a bone marrow stimulant).

10. Moisturizer
Aloe vera extract produced skin hydration. The mechanism predicted was humectants mechanism along with the occlusive layer formation on the skin by the formulations.

11. Immunomodulator

The study showed that the higher dose of Aloe vera gel extract stimulated the proliferation of stem cells, as seen from an increase in total white blood cells. Hence it was concluded that the Aloe vera gel extract may be a potential candidate in several immune-suppressed clinical conditions.

12. Protection of skin from UV-A & UV-B rays

Most commonly used herbs were aloe vera, basil, green tea, almond, olive, jojoba, and cucumber etc., incorporated in herbal sunscreens.

13. Wound healing

The study reported to promote gain in tensile strength in the incision wound model, but do not modify the granulation phase of healing. These herbs have also been reported to promote epithelization and wound contraction in cases of excision wound models. This property may be due to the effect of these herbs on migration and mitosis of epithelial cells, and promotion of contraction of myo-fibroblasts is responsible for wound contraction.

Abbreviation key: IC- Interpatient control, PB-Partially blinded, SC- Single centre, MC- Multicentre, R-Randomized, DB- Double blinded, PC- Placebo controlled, SB- Single blinded, PG- Parallel group.

USES
- Mild to moderate burns
- Erythema
- Genital herpes
- Seborrheic dermatitis
- Psoriasis vulgaris
- Skin moisturizer
- Type 2 diabetes
- Oral lichen planus infections
- Angina pectoris
- Ulcerative colitis
- UV-induced erythema
- Kidney stones
- Alveolar osteitis

Dosage
- For seborrheic dermatitis: 30% aloe vera in a hydrophilic emulsion twice daily to affected area
- For psoriasis and genital herpes: Hydrophilic cream containing 0.5% aloe gel 3 times daily to affected area
Treatment of diabetes and angina pectoris: recommended in humans, 100 mg of fresh inner gel each day or 1 tablespoon twice daily.\textsuperscript{32,33}

For ulcerative colitis and irritable bowel syndrome: a dose of 25–50 ml of 95% aloe inner gel is recommended 3 times daily.\textsuperscript{35}

Adjuvant therapy in feline and canine malignancies: Acemannan Immunostimulant\textsuperscript{®}, a special preparation of the clear mucilaginous gel specifically for injection, for intraperitoneal injection in cats and dogs following chemotherapy. Weekly injections over at least 6 weeks; recommended dose is 1 mg/kg body weight of animal.\textsuperscript{44,45}

Duration of Administration
External administration 3–4 times daily to affected area until improvement is seen.\textsuperscript{25,27,28} No information for duration after oral application in humans is available, but generally the gel is taken as long as the symptoms persist.\textsuperscript{32}

Contraindications
Known allergy against aloe vera; discontinue use if skin irritation develops or worsens.\textsuperscript{46}

Pregnancy and Lactation
It is not recommended to use aloe vera gel during pregnancy or while breastfeeding.\textsuperscript{47} There is, however, no evidence that suggests a reproductive or genotoxic effect of topical aloe vera inner gel preparations. Internal use in combination with digoxin is contraindicated due to possible acceleration of potassium depletion.\textsuperscript{48}

Adverse Effects
In general, topical application of aloe vera preparations has been regarded as safe as assessed by the Cosmetic Ingredient Review Expert Panel.\textsuperscript{43} However, several case reports of the development of hypersensitivity reactions and contact dermatitis in response to topically applied aloe gel preparations have been published.\textsuperscript{49–53} This allergic reaction has been attributed in most cases to anthraquinone contaminations in the gel.\textsuperscript{46} Macrophage infiltration and emesis has been observed in dogs treated intravenously with acemannan.\textsuperscript{54} Oral application of aloe vera gel may lower blood glucose levels and enhance the activity of antidiabetic treatments.\textsuperscript{32} No genotoxic effects have been observed following oral administration of an aloe vera inner leaf gel (Qmatrix\textsuperscript{®} by Aloecorp, Inc., which is a standardized inner gel extract that has not been heated after extraction from the leaf) to rats after 90 days.\textsuperscript{55} An important factor for adverse effects is the purity of the aloe vera gel used, since anthraquinones like aloin might be related to the development of hypersensitivity reactions.\textsuperscript{49,56}

Drug Interactions
When aloe vera gel is administered topical, it is generally regarded as safe.\textsuperscript{47} Aloe gel might enhance the ability of hydrocortisone to reduce swelling if applied topically.\textsuperscript{57} If ingested, it might lead to increased hypoglycemia in conjunction with oral antidiabetics or insulin.\textsuperscript{46} The American Pharmaceutical Association rates aloe vera gel for external use in category 2, meaning that “according to a number of well-designed studies and common use, this substance appears to be relatively effective and safe when used in recommended amounts.”\textsuperscript{58} Aloe vera inner gel may significantly increase the absorption of vitamins C and E after oral application.\textsuperscript{59} Aloe vera gel for systemic application is not recommended in combination with antidiabetic, diuretic, or laxative drugs; sevoflurane; or digoxin.\textsuperscript{57} In general, a 2-hour time period is recommended between oral drug application and aloe vera ingestion due to increased intestinal motility and reduced drug absorption.\textsuperscript{48} If aloe vera gel is used with any other prescription drug, the patient should inform the physician and/or pharmacist.
